Controlling Pods with Deployments
Creating a Deployment for a Spring Boot application
7.3 Service discovery and load balancing
Understanding service discovery and load balancing
Client-side service discovery and load balancing
Server-side service discovery and load balancing
Exposing Spring Boot applications with Kubernetes Services
7.4 Scalability and disposability
Ensuring disposability: Fast startup
Ensuring disposability: Graceful shutdown
Scaling Spring Boot applications
7.5 Local Kubernetes development with Tilt
Inner development loop with Tilt
Visualizing your Kubernetes workloads with Octant
7.6 Deployment pipeline: Validate Kubernetes manifests
Validating Kubernetes manifests in the commit stage
Automating Kubernetes manifests validation with GitHub Actions
Part 3 Cloud native distributed systems
8 Reactive Spring: Resilience and scalability
8.1 Asynchronous and non-blocking architectures with Reactor and Spring
From thread-per-request to event loop
Project Reactor: Reactive streams with Mono and Flux
Understanding the Spring reactive stack
8.2 Reactive servers with Spring WebFlux and Spring Data R2DBC
Bootstrapping a reactive application with Spring Boot
Persisting data reactively with Spring Data R2DBC
Implementing the business logic with reactive streams
Exposing a REST API with Spring WebFlux
