Listing 11.7 Requiring authentication for all endpoints through OIDC

```
@EnableWebFluxSecurity
public class SecurityConfig {

  @Bean
  SecurityWebFilterChain springSecurityFilterChain(
   ServerHttpSecurity http
  ) {
    return http
      .authorizeExchange(exchange ->
        exchange.anyExchange().authenticated())
      .oauth2Login(Customizer.withDefaults())      ❶
      .build();
  }
}
```

❶ Enables user authentication with OAuth2/OpenID Connect

Let’s verify that this works correctly. First, start the Redis and Keycloak containers. Open a Terminal window, navigate to the folder where you keep your Docker Compose file (polar-deployment/docker/docker-compose.yml), and run the following command:

```
$ docker-compose up -d polar-redis polar-keycloak
```

Then run the Edge Service application (`./gradlew bootRun`), open a browser window, and head to http://localhost:9000. You should be redirected to a login page served by Keycloak, where you can authenticate as one of the users we created previously (figure 11.4).
