```

❶ The checksum of the migration script, used to ensure the file has not been changed

❷ Description of the migration

❸ When the migration was performed

❹ The name of the script containing the migration code

❺ The state of the migration execution

❻ The type of migration (SQL or Java)

❼ The migration version (as defined in the script filename)

## *13.5.2 Exposing application information*

Among all the endpoints implemented by Spring Boot Actuator, `/actuator/info` is the most peculiar one, since it doesn't return any data. Instead, it's up to you to define what data you consider useful.
