Listing 14.5 Configuration properties provided via a ConfigMap

```
polar:
  greeting: Welcome to the book catalog from Kubernetes!
spring:
  datasource:
    url: jdbc:postgresql://polar-postgres/polardb_catalog
  security:
    oauth2:
      resourceserver:
        jwt:
          issuer-uri: http://polar-keycloak/realms/PolarBookshop
```

Then delete the configmap.yml file. We won't need it anymore. Finally, update the kustomization.yml file to generate a `catalog-config` ConfigMap starting from the application.yml file we just created.

Listing 14.6 Getting Kustomize to generate a ConfigMap from a property file

```
apiVersion: kustomize.config.k8s.io/v1beta1
kind: Kustomization

resources:
  - deployment.yml
  - service.yml

configMapGenerator:                ❶
  - name: catalog-config
    files:                         ❷
      - application.yml
    options:
      labels:                      ❸
        app: catalog-service
```

❶ The section containing information to generate ConfigMaps

❷ Uses a property file as the source for a ConfigMap

❸ Defines the labels to assign to the generated ConfigMap

NOTE In a similar way, Kustomize can also generate Secrets starting with literal values or files.
