blockchain client (test chain) called Ganache that is part of the Truffle IDE suite.

Download Ganache from https://www.trufflesuite.com/ganache, and install it by clicking the downloaded file and clicking the Quickstart button. It is useful to pin the Ganache to the taskbar for quick access.

Ganache is also an Ethereum client, and by default, it is configured to run on the localhost. It's ideal for testing your Dapp prototypes; it provides ten accounts, each with 100 mock ether for paying for the gas points for execution as well as for transferring among accounts. Its blockchain interface is shown in figure 4.4. Toward the top, you'll see a set of seed words or *mnemonics*; copy and save them somewhere, because you'll need them to authenticate access to the chain during testing of the Dapp.
