- A dependency on the `express` module for defining the web application

Modify your package.json file so that it looks like the following listing. You can also copy the prefilled package.json provided in the codebase of this chapter.

Listing 4.4 package.json

```
{
  "name": "ballot-app",
  "version": "1.0.0",
  "description": "",
  "main": "index.js",
  "scripts": {
    "start": "node index.js"     ❶
  },
  "author": "",
  "license": "ISC",
  "dependencies": {
    "express": "^4.17.1"         ❷
  }
}
```

❶ Start script for Node.js server

❷ Dependency on express module

Express is one of the many web application frameworks for the Node.js server; you'll use the `express` module to specify the script for the entry point of the server. (I'll refer to the web server as the Node.js server instead of the Node server to distinguish it from the blockchain node.)
