

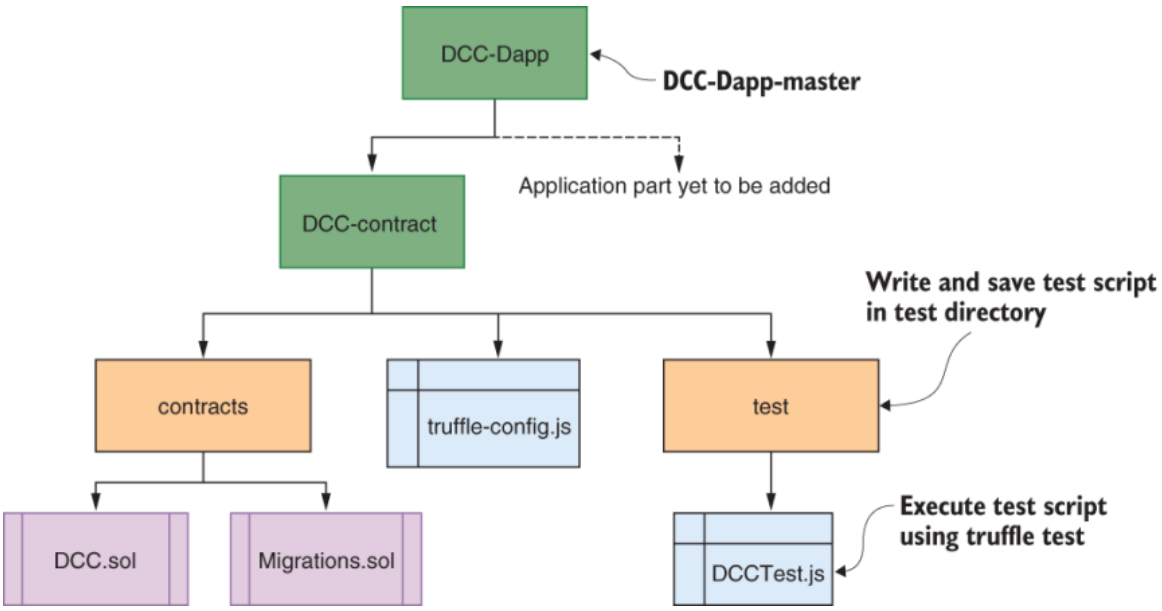

Figure 11.7 Directory structure for the smart contract part of DCC

Now you are ready to run the test. Navigate the DCC-contract directory. Make sure that the Ganache test chain is ready. Then run the `truffle test` command. The commands are repeated here for review:

```
cd DCC-contract
npm install
truffle test
```

The output shows positive and negative tests. Figure 11.8 shows only a partial list of 38 tests, some positive and some negative, for the category capstone project. DCCTest.js also contains scripts for the other three categories (prerequisites, core, and domain-specific courses). Just imagine running these 38 tests manually!
