Composition or aggregation relationships are used when a class is composed of one or more other classes of objects. Using the same example, an `Auto` is composed of many other classes of objects or aggregations of objects, as shown in figure A.7. (The solid diamond shape at the head of the arrow indicates this type of relationship). These classes include `FuelInjection`, `CruiseControl`, and `AntiLockBrakes`. Note that I haven't filled in any fields or functions in the class definitions because I'm not an expert in this domain. If your team doesn't contain a domain expert, it will need to collaborate with one to fill in these kinds of details.
