

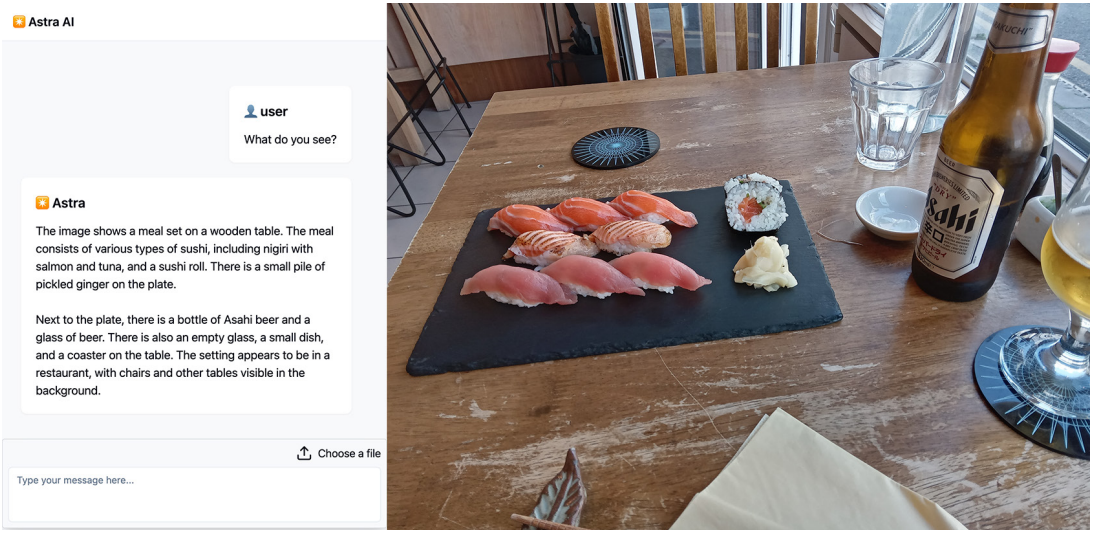

Figure 3.8 Uploading an image and getting an accurate description from the AI model. This functionality shows how the LLM can generate text descriptions from other media-like images.

Feel free to upload your own images and ask questions about them. To enhance the user experience, consider adding a small preview of the uploaded image alongside the upload area.

> **NOTE** While some LLMs now possess impressive vision capabilities, not all of them do. When choosing a model for your project, it's crucial to verify its capabilities. The Vercel AI SDK provides a helpful compatibility table for various providers and models here: https://mng.bz/Jwea.

We've accomplished a significant amount of work enhancing the functionality of our Astra AI web application. In the next chapter, we'll explore more advanced tools and techniques to further elevate our application's capabilities and user experience.

Summary

- The Vercel AI SDK simplifies AI integration into web applications.
- It also offers features such as provider abstraction, streaming responses, state management, and support for React server components.
- The SDK allows developers to break down complex AI tasks into smaller, more manageable components.
- Guidelines for integrating the SDK include separation of concerns, abstraction layers, incremental integration, testing and validation, and documentation.
- The SDK provides functions like `generateText` and `streamText` for text generation.
