Similarly, you can restore the state of the messages by having a function that loads the contents from the database and passing it into the `initialAIState`:

```
const savedState = await loadFromDatabase();
const AI = createAI({
    initialAIState: savedState,
});
```

GETMUTABLEAISTATE

`getMutableAIState` is a crucial function for managing AI state within server actions. When called, it returns an object that represents the current AI state. You can use this state object to retrieve the latest information about the AI's context, such as conversation history or any other relevant data. Additionally, you can do the following:

- *Update the AI state*—You can add new messages, update existing information, or make any other necessary changes to the AI state.
- *Mark the AI state as "done" (fully updated)*—This is particularly useful in streaming scenarios, signaling that all updates for the current interaction have been completed.

While `getMutableAIState` manages the AI state on the server, it works in conjunction with client-side state management to keep the UI in sync.

USEACTIONS

`useActions` is a hook that provides access to the actions defined in your `createAI` call. It allows client components to trigger server actions and update the AI state.

USEUISTATE

`useUIState` is a hook that provides access to the UI state within client components. It returns the current UI state and a function to update it, similar to React's `useState`.

USEAISTATE

`useAIState` is a hook that provides read-only access to the AI state within client components. This allows you to use the AI state for rendering or logic without directly modifying it.

All these functions and hooks work hand in hand to create a seamless state management system for UI applications. They allow you to

- Separate concerns between AI and UI states.
- Manage complex state updates on both client and server.
- Ensure consistency between what the model sees and what the user interacts with.
- Create reactive UIs that respond to AI-generated content in real time.
