Rebuild the application and notice the new changes in the UI. You should observe now that our agent responds with a table format to our queries. Figure 4.13 is a screenshot of some of the interactions I've had with it.

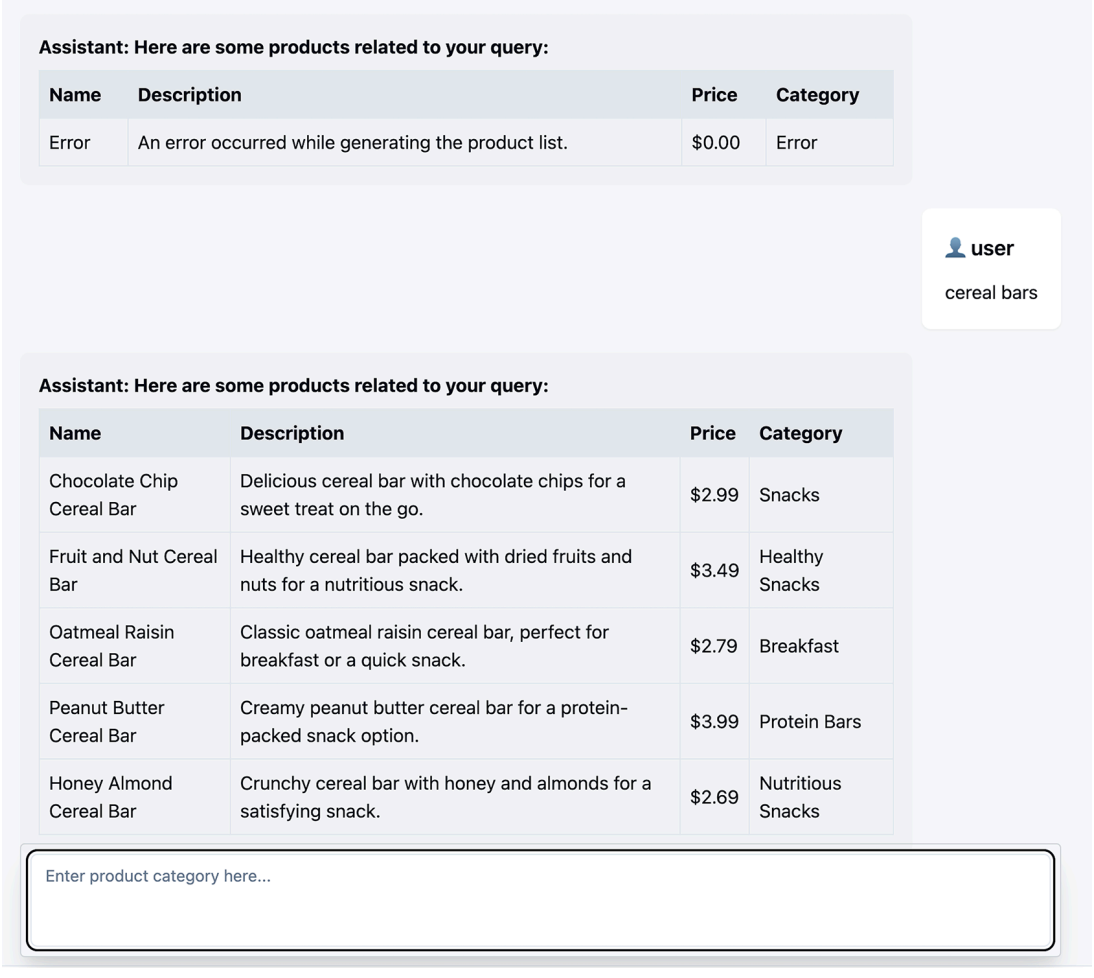

Figure 4.13 Our Astra AI web application can now respond with structured data. We can ask it to generate product categories, which we render in a table format.

Of course, you can improve this functionality to respond to different kinds of structured responses, each with a different representation.

Feel free to continue experimenting with different types of product categories and query structures. The more you interact with the system, the better you'll understand its capabilities and potential applications in real-world scenarios.
