in yours it might be different. By using "some" in the instructions, the model may interpret this as an open-ended request and generate more examples than intended. To avoid this, it would be better to provide a more precise instruction, such as

```
List 5 popular programming languages along with a brief description of each:
```

When your prompts are specific and unambiguous, you minimize the risk of the AI misinterpreting your intent. This clarity allows the model to focus on the key elements you want to emphasize, leading to more consistent and reliable outputs.

Now let's see a more realistic example. Say you want to craft a prompt designed for a customer support chatbot that utilizes few-shot learning to adapt its tone and sentiment based on example interactions for different use cases. The example prompt in the following listing demonstrates how to guide the AI model to generate responses for a customer support web application.

Listing 5.6 Example of few-shot learning for a customer support bot

```
const system = `
   You are a customer support chatbot. Adapt your tone and
sentiment based on the following example interactions
for each supported use case:
  **Use Case 1: Technical Support**
  **User:** My internet connection is really slow.
Can you help me?
  **Chatbot:** I'm sorry to hear that you're experiencing
slow internet speeds. Let's troubleshoot this together.
Can you please provide me with your current
speed test results?

  **Use Case 2: Billing Inquiry**
  **User:** I was charged twice for my subscription this
month. What happened?
  **Chatbot:** I understand how concerning double charges
can be. Let me check your account details and resolve this
issue for you right away.

  **Use Case 3: General Inquiry**
  **User:** What are your customer support hours?
  **Chatbot:** Our customer support team is available 24/7
 to assist you with any questions you may have.
  Now, respond to the following user inquiries using the
appropriate tone and sentiment:
`;
```

The use case title sets the context for the kind of issue the user might present.

This represents a typical user query within the technical support use case. It's a specific issue that the user is facing, which the chatbot needs to address.

This is the chatbot's response to the user query in use case 1. The response showcases empathy and willingness to help. This example illustrates the tone and sentiment the chatbot should adopt for technical support interactions.

Each of these calls to the support function represents a different type of user query that the chatbot might handle, utilizing the tone and sentiment based on the provided examples in the prompt.
