5.2.2 General methodology for creating few-shot learning prompts

Now that you have a good grasp of the examples, let's look at a general template for creating few-shot learning prompts. We can identify the following key steps for creating a nicely formatted prompt utilizing few-shot learning:

1. *Set the context for the task.* Begin by clearly defining the role of the AI or chatbot. Describe the overall task it needs to accomplish. This adjusts the AI model's outputs with your expectations.
   Example: "You are a customer support chatbot. Adapt your tone and sentiment based on the following example interactions for each supported use case."
2. *Identify the example use cases.* List different scenarios or use cases that the AI might encounter. Each use case should represent a different type of interaction the AI needs to handle.
   Example: "Use Case 1: Technical Support"
3. *Provide example interactions.* For each use case, provide a clear example of a user query and the appropriate AI response. For example,
   User—"My internet connection is really slow. Can you help me?"
   Chatbot—"I'm sorry to hear that you're experiencing slow internet speeds. Let's troubleshoot this together. Can you please provide me with your current speed test results?"
4. *Ensure variety across examples.* Use diverse examples that cover different aspects of the use case, such as technical issues, billing inquiries, or general questions.
   Example: "Use Case 2: Billing Inquiry," "Use Case 3: General Inquiry"
5. *Conclude with an instruction or directive.* After providing the examples, instruct the AI on how to respond to new queries using the tone and sentiment demonstrated in the examples. For example,
   "Now, respond to the following user inquiries using the appropriate tone and sentiment."

The examples serve as a blueprint for the AI to adapt its communication style to different scenarios. Feel free to practice this methodology for the following examples to help your AI model adapt to specific tasks without requiring extensive fine-tuning or retraining.

- *Customer support for e-commerce platform*—In an e-commerce setting, a customer support chatbot must handle various inquiries, from order status checks to product return requests.
- *Educational tutoring support*—In an online tutoring application, an AI model needs to provide step-by-step guidance to students on various subjects like biology or chemistry.

As a quick recap, few-shot learning offers an accessible and efficient way to guide AI models in generating contextually appropriate responses by providing just a handful
