6 Building AI workflows with LangChain.js

This chapter covers

- Using LangChain.js core features to build context-aware AI applications
- `PromptTemplate`, few-shot learning, and other strategies for prompt management
- Chaining calls to improve generative AI responses
- Preparing and storing information for efficient document ingestion and retrieval
- Using memory components in LangChain.js to remember conversation history
- Integrating LangChain.js with the Vercel AI SDK

As we have explored using large language models (LLMs) for generating content, we've primarily focused on single interactions. In these scenarios, we send a prompt along with relevant context history, parse the response, and then display it to the end user. However, what if we want a more flexible approach that accommodates more complex scenarios?
