

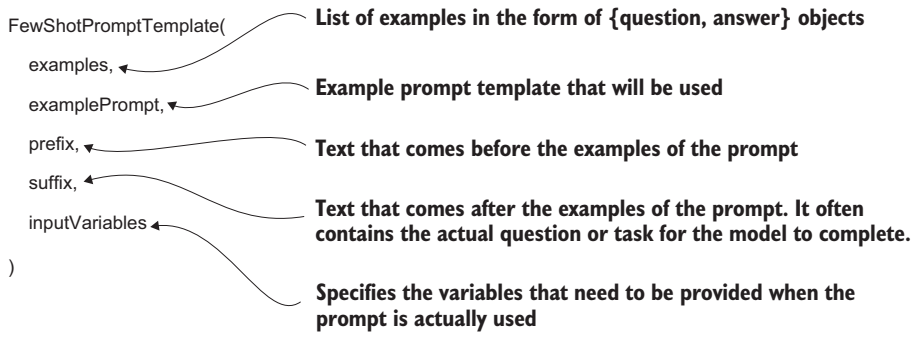

Figure 6.2 The `FewShotPromptTemplate` class takes five key parameters: `examples` (a list of question-answer pairs serving as reference examples), `examplePrompt` (a template for formatting each example), `prefix` (introductory text preceding the examples), `suffix` (concluding text following the examples, typically containing the main task or question), and `inputVariables` (specifying the variables to be provided when the prompt is used).

The following listing shows how to use the `FewShotPromptTemplate` to construct a comprehensive prompt template that uses few-shot learning that can be formulated in interactions with LLMs such as OpenAI.

Listing 6.2 Creating a few-shot prompt template

```
const examplePrompt = PromptTemplate.fromTemplate(
  "Question: {question}\nAnswer: {answer}"
);
const prefix = `You are an intelligent assistant designed
to answer questions accurately and concisely.
Below are some examples of how to approach different
types of questions. Pay attention to whether follow-up
questions are needed and how the final answer is presented.
After reviewing these examples, please answer the user's
question in a similar format.

Remember:
1. Determine if follow-up questions are needed.
2. If yes, ask the follow-up and provide an intermediate answer.
3. Always conclude with a final answer.

Here are some examples:`;

const prompt = new FewShotPromptTemplate({
  examples,
  examplePrompt,
  prefix,
  suffix: "Question: {input}",
  inputVariables: ["input"],
});
```

The examplePrompt defines how each example should be formatted using placeholders for dynamic content.

The prefix provides context and guidelines for how to respond based on previous examples, ensuring consistency in output.

The FewShotPromptTemplate combines all components (examples, formatter, prefix) into a single template that can be formatted with user input.
