We will be using

```
import { ChatGoogleGenerativeAI } from "@langchain/google-genai";
// import { ChatOpenAI } from '@langchain/openai';
```

Then, to integrate chain calls and stream the results back to the UI, we'll utilize the `createStreamableUI` function from the Vercel AI SDK and a new function, `getChainStream`, that returns a stream of the chain results as generated from the LLM.

Recall that the `createStreamableUI` returns an object that allows us to manage the UI updates dynamically. When we create a runnable chain using the `RunnableLambda.from` method, we can initiate a stream by calling `chain.stream()`. This setup enables us to push updates to the UI via the update methods and subsequently return the stream values. The rest is up to the Next.js server to render the components to the UI in real time.

Figure 6.4 showcases the steps of this workflow. The main idea is to feed the result of the first stream (the LangChain stream object) to the input of the `createStreambleUI` stream so that the UI will update in real time.

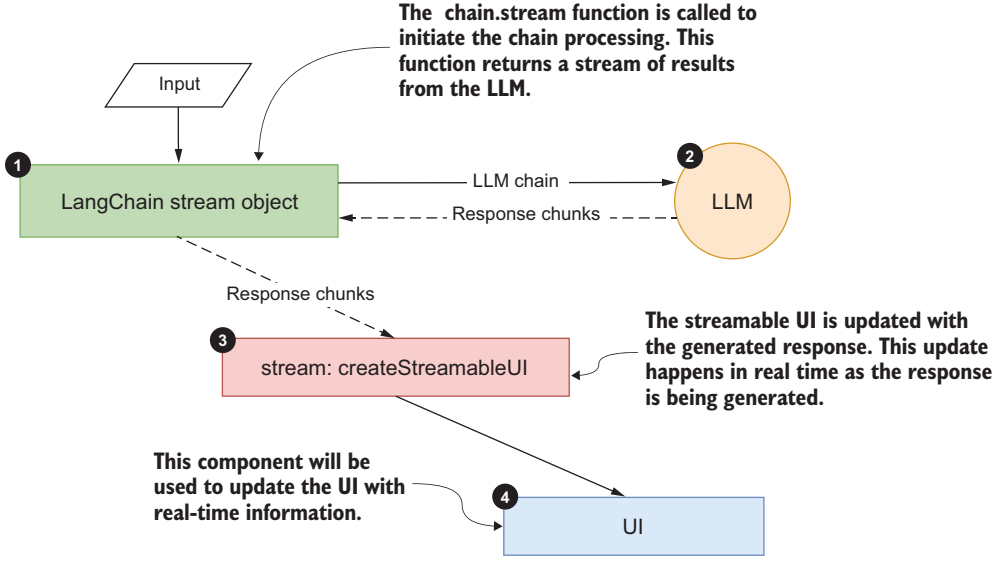

Figure 6.4 Step-by-step integration of the LangChain stream results with the `createStreambleUI` object. Every time there is an update, we push it to the UI stream, which in turn updates the UI in real time.

Here are the main steps to integrating chain calls:

1. The user provides an input prompt.
2. The `chain.stream` function is called to initiate the chain processing. This function utilizes the LangChain runnables that include calls to the LLM API and
