In the second use case (figure 7.5), the user pastes some text in the message box instead of the file upload, and the AI web app again provides a summary of that text. Feel free to run the application locally and explore its functionality.

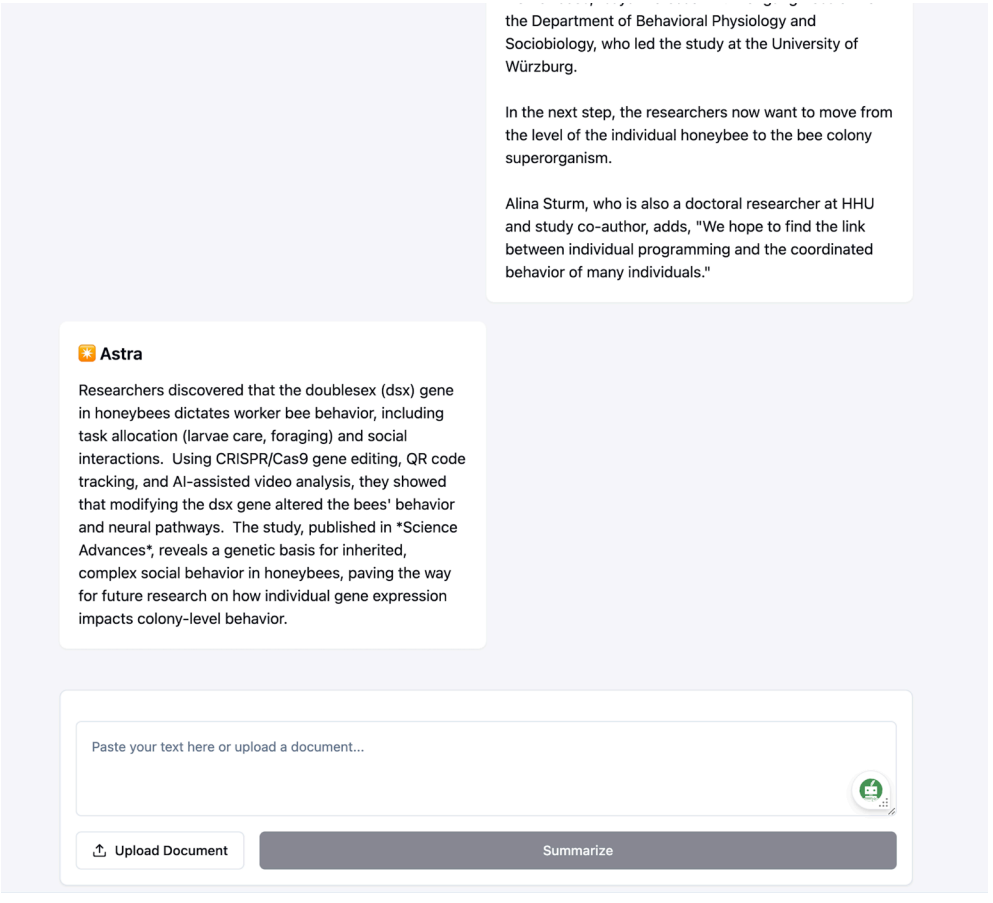

Figure 7.5 The user in this case can directly paste long-form text that utilizes the same service to summarize it.

Now let's take a closer look at the key pieces of code that run within the server actions file. The main idea of this new input is to submit either the text or the binary format of the file upload using a server action. Next.js will make sure to transfer the binary file from the UI to the backend service seamlessly. Then, in the `continueConversation` action, we check if the input was a file or text and process the input accordingly.

We are only highlighting the important parts related to handling text and file-based summarization input, since the rest of the codebase remains the same.
