difficult for the user to read. Alternatively, you could also restructure the chat message container so it has its own fixed height and position within the page.

Tailwind.css has some convenient utility classes that you can use to add padding in containers:

- `p-4`—Applies padding of `1rem` on all sides
- `px-8 py-4`—Applies horizontal padding of `2rem` and vertical padding of `1rem`
- `p-0`—Sets no padding at all

In our example projects, we used `py-24`, which adds a `6rem` padding to the vertical axis, giving us space for the message box form.

Another challenge is that while the application scrolls on some messages, it does not scroll on some of the longer messages when streaming the content back to the user. This might happen because of how React triggers the `scrollToBottom` callback in the `useEffect` hook. If the conversation object reference does not change, React won't be able to trigger this effect:

```
useEffect(() => {
    scrollToBottom();
}, [conversation]);
```

If you are using streaming responses, ensure that each new chunk of data is treated as a separate update to the conversation state. This can be achieved by updating the state in such a way that it creates a new reference each time new data is received:

```
setConversation(prev => [...prev, newMessage]);
```

Even a small feature, such as scrolling behavior, can have many moving parts that can go wrong. Spending time learning about these intricacies, side effects, and edge cases will pay off significantly when building the application or debugging some of the unexpected behaviors. But this is part of being a developer.

STREAMING-RESPONSES PROBLEMS

Streaming is working properly when set up correctly in a Next.js application. For streaming to work with the Next.js app router, you need to ensure that caching is disabled for the page. This can be accomplished by using the following configuration at the top of the page.jsx component that corresponds to the route segment configuration:

```
// Force the page to be dynamic and allow
// streaming responses up to 30 seconds
export const dynamic = 'force-dynamic';
export const maxDuration = 30;
```

Another reason that streaming may not work depends on where you deploy the application. For example, when deploying on Vercel, you may encounter problems with caching that prevent streaming from functioning correctly. To address this, you can
