```
<ChatBubble
      role="error"
      text={userError.message}
      className="mr-auto border-none error"

    >
      {userError.requestId && (
        <button onClick={retryAction}>Retry</button>
      )}
    </ChatBubble>
```

Since React server components are streamable functions, we use this abstraction as much as possible, making it easier for developers to add robust error-handling mechanisms with relevant call-to-action components.

Checking the official Vercel AI SDK issue tracker

Remember to stay informed about existing bugs and their workarounds. The SDK is actively maintained, but like any software, it can have problems that affect your implementation. The primary source for known problems is the GitHub repository's bug tracker. (https://github.com/vercel/ai/labels/bug), shown in figure 8.6. Make sure you review this tracker if you encounter an unknown problem to see if someone else has experienced it before.

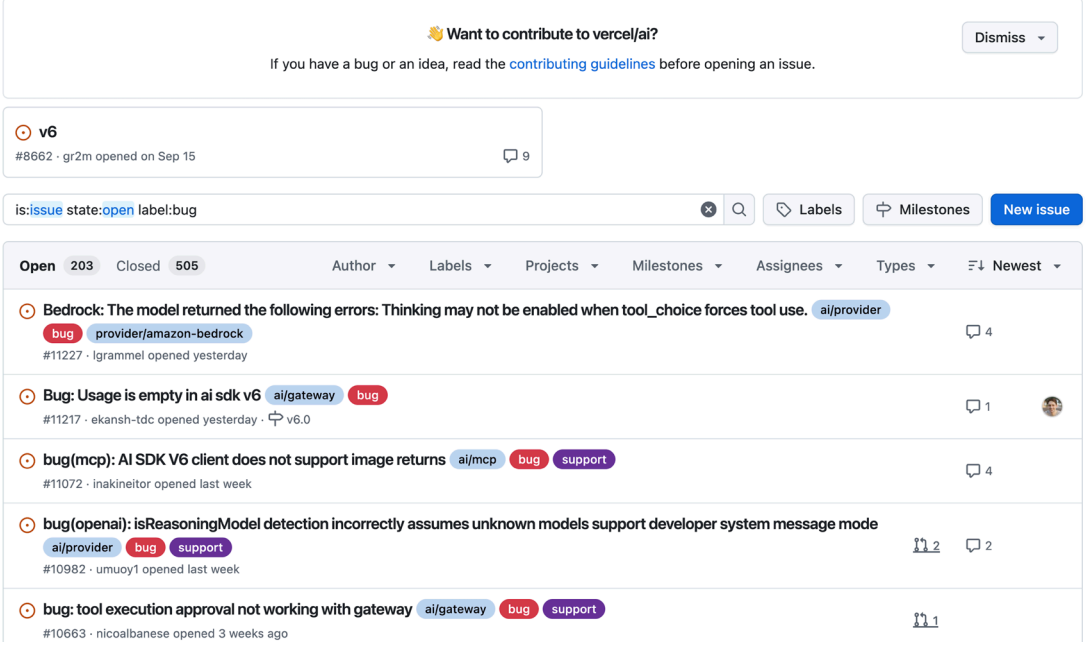

Figure 8.6 Check the current list of open bugs/issues on the official Vercel AI SDK repository to get insight into a potentially relevant problem that you've encountered.
