```
            { type: 'text-delta', textDelta: 'a test ' },
            { type: 'text-delta', textDelta: 'of streaming.' },
            {
              type: 'finish',
              finishReason: 'stop',
              logprobs: undefined,
              usage: { completionTokens: 15, promptTokens: 5 },
            },
          ],
        }),
        rawCall: { rawPrompt: null, rawSettings: {} },
      }),
    }),
    prompt: 'Start streaming!',
  });
```

The result object exposes a `textStream` property, which we can call repeatedly until the stream is closed (exhausted). After all chunks are received, we can join them into a single string and assert that the complete output matches the expected string.

The complete unit test for this streaming example, including the `streamText` and `simulateReadableStream` usage, is located at ch08/chat-testing/tests/test-vercel-ai.js.

TESTING THE CONTINUECONVERSATION SERVER ACTION

Now let's get more practical. Let's say we want to test the `continueConversation` function from the chapter 3's code, where we introduced the React server component actions. Here is the snippet:

```
export async function continueConversation(input, history, provider, model) {
  'use server';
  const supportedModel = getSupportedModel(provider, model);
  const result = await generateText({
    system: "I'm happy to assist you in any way I can.
How can I be of service today?",
    prompt: input,
    model: supportedModel,
    maxTokens: 512,
  });
  return {
    messages: history,
    newMessage: result.text,
  };
}
```

To effectively test this function, we will utilize mocking to simulate the behavior of the AI model and ensure that our function behaves as expected under various scenarios.

In our testing strategy, we can use the logic within the `getSupportedModel` function. By mocking this function, we can return an instance of the `MockLanguageModelV1` class instead of a real model. This enables us to focus on testing the core functionality of `continueConversation` without being affected by external factors such as network
