providers like Vercel always put their assets on a CDN by default, so you may not have to do a lot of work here.

  - *Enhanced security measures*—Implement advanced security measures, such as intrusion detection systems, web application firewalls, and regular security audits, to protect against more sophisticated threats. This means that you must employ additional services like Vercel Firewall to cover such scenarios.
  - *Comprehensive error tracking and logging*—Set up detailed logging and error tracking to capture all relevant information for debugging and auditing, which will allow you to quickly identify and resolve problems. You may have to utilize an external provider like Sentry or Datadog to provide a more customizable experience.
- *Tier 3: Large-scale applications (>100,000 requests/day)*—For high-traffic applications, you'll need enterprise-grade solutions to handle the immense load and ensure maximum uptime. At this tier, you should deploy higher-grade (thus more expensive) solutions to accommodate those policies, including
  - *Distributed logging and observability*—Include a distributed logging system that aggregates logs from all components of your application, which will provide a centralized view for troubleshooting and analysis.
  - *Geographic distribution*—Distribute your application across multiple geographic regions to minimize latency for users around the world and improve resilience in the face of regional outages. You may have to store content close to your customers and run application instances in regions close to your data.

Once you have a rough estimate of the amount of traffic you are expecting on your web application, create a checklist that covers the basic requirements to ensure a successful production deployment.

> **NOTE** It's fine to include scaling strategies from other levels, like CDNs and firewalls, even if your application's traffic doesn't yet require a higher tier. Implementing these measures early can prepare your infrastructure for future growth and enhance overall reliability.

PRODUCTION DEPLOYMENT CHECKLIST FOR AI WEB APPLICATIONS

The following is a checklist of good practices:

- Cost management
  - Understand pricing models of LLM providers.
  - Monitor and optimize API calls to reduce costs.
- Data privacy
  - Evaluate privacy policies of LLM providers.
