

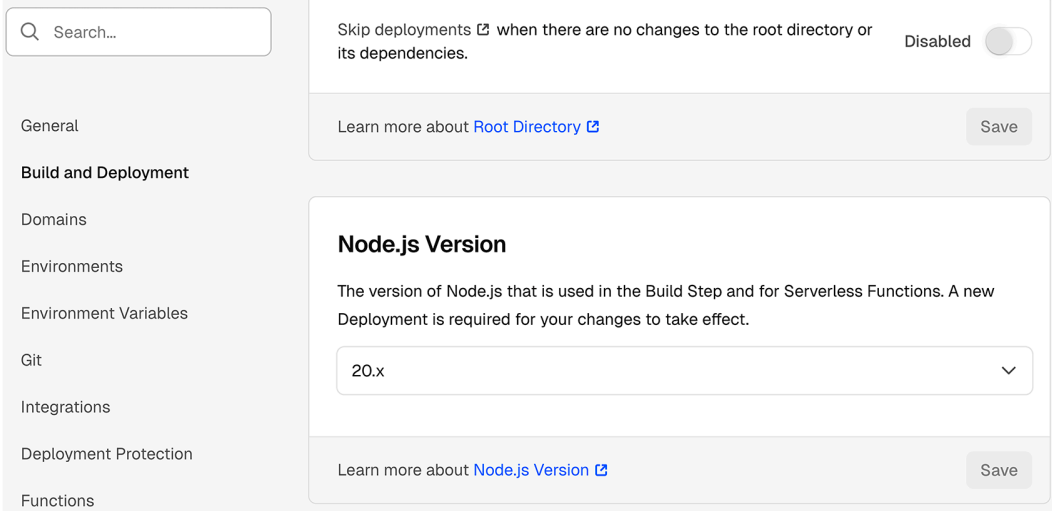

Figure 9.8 Vercel dashboard build configuration settings screen showing where we set the Node.js version to 18.x for both the build step and serverless functions

DEPLOYMENT INSTRUCTIONS USING THE VERCEL CLI

The following instructions show how to use the Vercel CLI tool to deploy the web application from your command line to the platform project:

1. Install Vercel CLI. Install the Vercel CLI globally using `npm`:

```
$ npm install -g vercel
```

2. Deploy to Vercel. Run the `vercel` command in your project directory:

```
$ vercel
```

If you are not logged in, the tool will ask you to log in first. Once this is completed, the build process will commence. You will be able to inspect the console logs about the status of the deployment. On success, you will be presented with a unique deployment URL where you can inspect the application (figure 9.9).

```
% vercel
        (main !?)
Vercel CLI 41.1.4
🔍  Inspect: https://vercel.com/theo-despoudis-projects/chat-deployment/GVqi96r8xCSjsJP5SXWE5FZW7
LUP [2s]
✅  Preview: https://chat-deployment-geasjmyb1-theo-despoudis-projects.vercel.app [2s]
```

Figure 9.9 Terminal output showing successful Vercel CLI deployment of a chat application. The deployment shows both the project dashboard URL and the preview domain, along with instructions for promoting to production using the `vercel --prod` command.
