Upon visiting the URL, you should be able to review the app functionality. If there was an error with the build process, then you will be presented with instructions on what happened and how to inspect the error logs (figure 9.10).

```
⊙ % vercel
                (main x!)
  Vercel CLI 41.1.4
  🔍  Inspect: https://vercel.com/theo-despoudis-projects/chat-deployment/3bBRf1PEoNVGWbFt573jNQ1oeCYc
  [2s]
  ✅  Preview: https://chat-deployment-eyjb518cu-theo-despoudis-projects.vercel.app [2s]
  Error: Command "yarn run build" exited with 1
  Error: Check your logs at https://chat-deployment-eyjb518cu-theo-despoudis-projects.vercel.app/_logs
  or run `vercel logs chat-deployment-eyjb518cu-theo-despoudis-projects.vercel.app`
```

Figure 9.10 Terminal output showing a failed Vercel deployment attempt with error messages. The output includes links to the deployment dashboard and preview URLs, along with instructions for viewing detailed error logs either through the web interface or via the `vercel logs` CLI command.

TROUBLESHOOTING DEPLOYMENT PROBLEMS

A lot of things can go wrong when deploying the web application to a server, so it's important to follow a methodical approach to troubleshooting the problems. Here are some useful tips that will help you fix certain problems:

- *Invalidate build cache*—Vercel caches some of the framework files and folders to speed up subsequent deployment. If some errors persist, try redeploying without using the existing cache. You can do this by using the `vercel --force` command.
- *Build errors*—If the `npm run build` command fails, check for any syntax errors or missing dependencies in your project. Ensure that all necessary packages are installed by running `npm install` or `yarn install` depending on your package manager. Then you can use Vercel's Build and Deployment settings page to change the build command that will run when pushing code changes.
- *Package manager problems*—If the `npm` command fails to deploy, try switching to `yarn` or `pnpm` in the Vercel Build and Deployment settings page. This can sometimes resolve problems related to package installation.
- *Check official discussions for any relevant problems*—It's highly recommended to consult the official Vercel discussions page at https://github.com/vercel/vercel/discussions. This is to check if deployment problems have likely been encountered and resolved by others and to ask specific questions related to your deployment challenges.

By following these steps, you should be able to deploy your web application to Vercel. If you encounter any problems, refer to the troubleshooting tips provided earlier or explore the Vercel discussions page for community insights.

POSTDEPLOYMENT EFFORT

After successfully deploying the web application to the public, you should monitor how it's being used by external users. To do this effectively, you need sophisticated tooling
