9.6.5 Alternative deployments: Hugging Face Spaces

Another viable option for deploying your application is Hugging Face Spaces. This platform is a great fit for projects that are specifically focused on machine learning and AI models, as it's designed to host and share these types of applications. It offers a variety of deployment options, including static sites, Gradio apps, and Docker-based deployments.

Unlike Vercel and Netlify, Hugging Face does not offer a CLI for deployment at this time. All project configuration and file uploads must be handled through the Hugging Face Spaces UI. This means you'll need to create your space, configure its settings, and manually upload your project files or link to a Git repository directly within the web interface:

- *Hugging Face documentation*—https://huggingface.co/docs/hub/spaces-overview
- *Getting started with Hugging Face Spaces*—https://huggingface.co/docs/hub/spaces

9.6.6 Next steps

After deploying your app and ensuring it is safe and protected, what comes next? It depends on your end goals and overall objectives for your web application:
