10 Building an AI interview assistant: Project walk-through

This chapter covers

- Building an AI interview assistant covering UX and technical implementation
- Configuring chat, text-to-speech, and feedback features
- Architecting the app with Next.js, the Vercel AI SDK, and Redis
- Managing conversations, data persistence, and AI responses
- Securing user data and preventing system abuse

In this chapter, we'll take a comprehensive tour through our AI interview assistant application, examining both its user-facing features and the technical decisions to make during development. We'll explore the architecture, which is built on all the fundamental tools and technologies that we've been working with: Next.js, the Vercel AI SDK, and Upstash Redis for data management. The full code for this project is in the project repository.
