

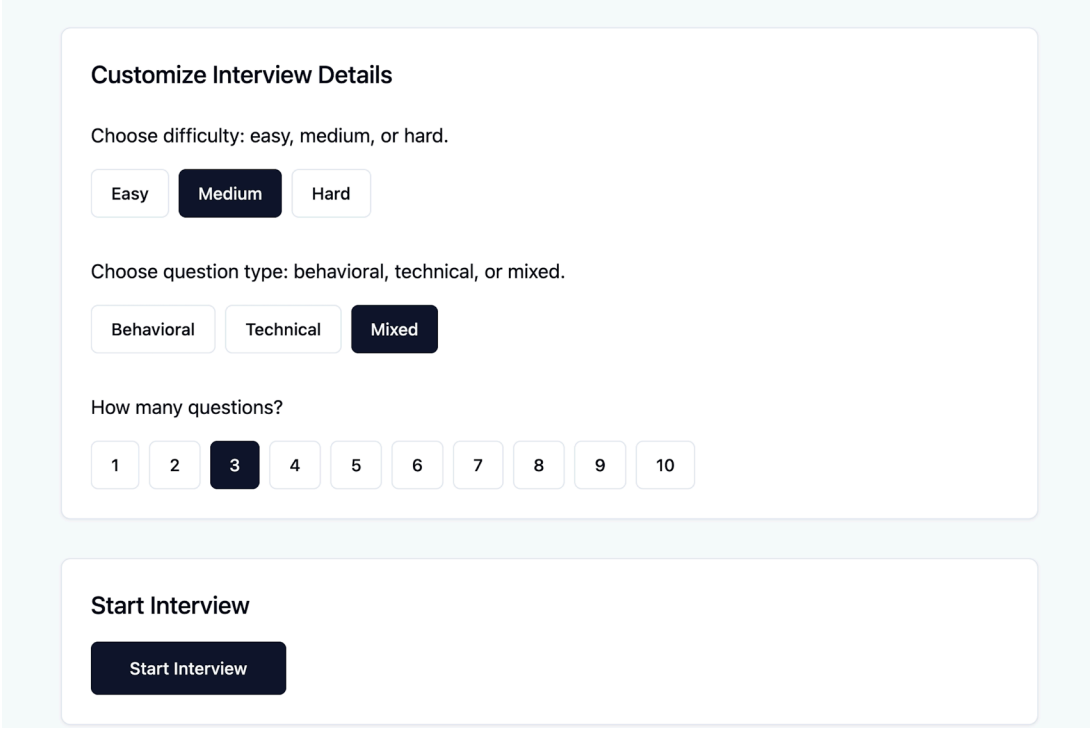

Figure 10.4 After the job description section, the user can configure the simulated interview experience with some options. They can change the difficulty, question types, and number of questions. Starting the interview will redirect them to the main chat UI page.

- *Conversational flow*—The interview progresses naturally through a chat interface, with the AI interviewer asking questions and responding to user answers with follow-ups when appropriate.
- *Context awareness*—The AI maintains awareness of previous questions and answers, allowing for a coherent interview narrative rather than disconnected questions.

In addition to the text-based interaction, the application exposes a way to conduct the interview via a microphone using text-to-speech. Users can enable text-to-speech functionality to hear questions spoken aloud using Google Cloud text-to-speech APIs. Users can enable or disable this functionality on demand by clicking the relevant sound icon. Figure 10.5 shows a screenshot of the chat page.

Interview closing and summary

Upon completion of all questions, users have access to these features:

- *Session close*—Users can close the interview session, locking further interactions with the agent.
