

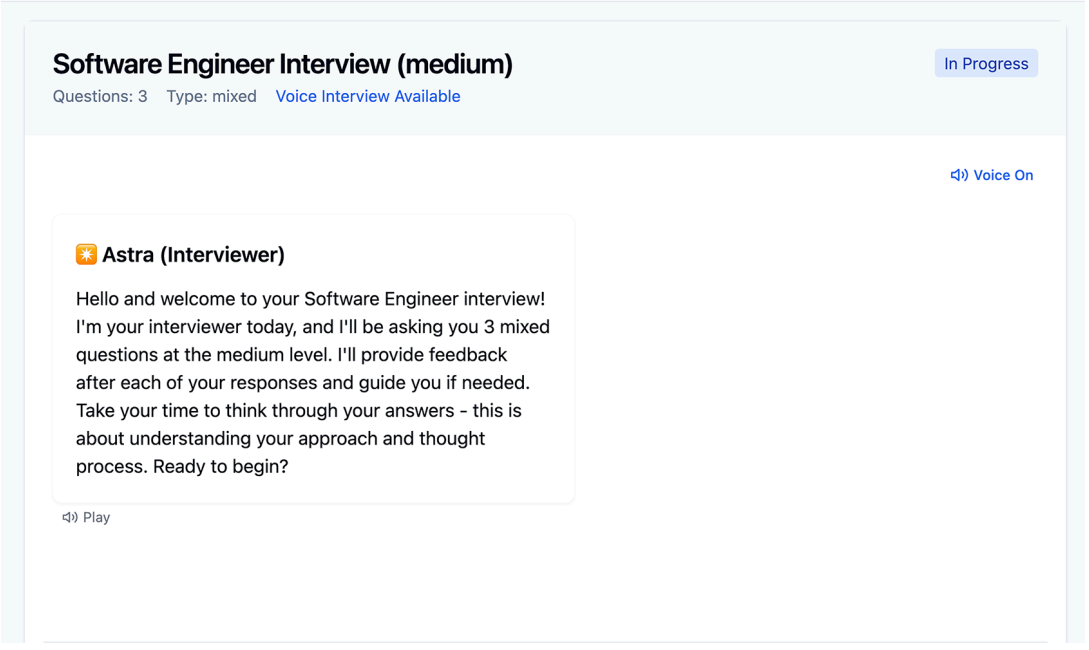

Figure 10.5 Once the interview starts, the user will be able to start answering the AI interviewer's questions. Additionally, the user can close the interview session, preventing any further interactions.

- *Quick summary and feedback*—The LLM analyzes the entire interview conversation to generate detailed feedback. Users receive an immediate overview of their performance, highlighting strengths and potential improvement areas.
- *Manual completion*—The user can click the "Complete interview" button to close the interview session and thus prevent any further modifications to the thread.

NOTE I intentionally did not allow the LLM agent to close the interview automatically once the question quota was reached. This decision was made to ensure users retain control over the session's closure.

PAST INTERVIEW SESSION REVIEW

Users can access a chronological list of all past interview sessions by selecting a session from the sidebar on the right-hand side. Initially, the sidebar session list for the current user will be empty, but once at least one interview session has been created, both current and past sessions will be listed there (see figure 10.6).

NOTE A missing feature in the current implementation is the ability to delete past sessions. I intentionally left this out to allow you to consider how such a feature might be implemented.
