CHATTING WITH A KNOWLEDGE BASE DOCUMENT

Once you have uploaded at least one document to a knowledge base, you can start interacting with the content through a conversational AI agent. Users can ask questions and receive answers grounded in the document data, enabling a natural, dialogue-based exploration of the knowledge base.

This functionality builds upon the retrieval techniques discussed in the previous chapter, where we created and utilized informational retrievers with LangChain.js. Unlike the local filesystem storage used earlier, here the vector embeddings are stored externally in Upstash Vector, allowing for a scalable and efficient similarity search.

When a user submits a query, the application embeds the question, performs a vector search to find the most relevant document chunks, and then uses the Vercel AI SDK to generate a context-aware response. Figure 11.5 shows a screenshot of a sample interaction where the uploaded document is *To Kill a Mockingbird* by Harper Lee.

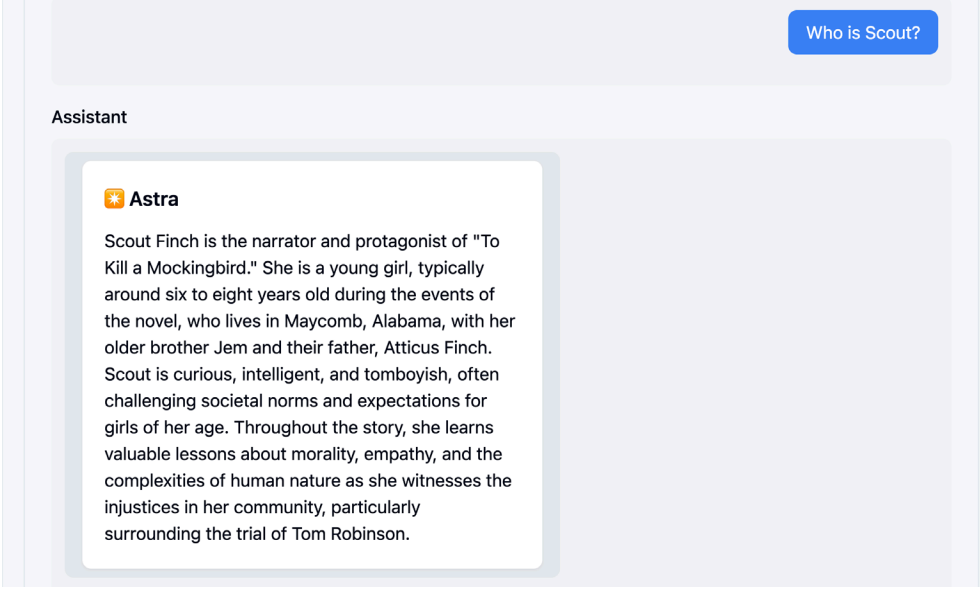

Figure 11.5 Once the knowledge base contains a few documents, users can start chatting with them conversationally.

OTHER FUNCTIONALITIES

Beyond the core features discussed earlier, the application includes some new ones. First, users can permanently delete a knowledge base, along with its associated documents and vector embeddings, via the Delete Knowledge Base button on the knowledge base details page. Second, individual documents can be removed from a knowledge base, which removes all document chunks that are associated with the deleted document.
