- *Knowledge base routes* (`/api/knowledgebase`)—These routes handle CRUD operations for knowledge bases, including creating new knowledge bases, retrieving all or individual knowledge bases, and deleting them. For example, the POST route validates input and creates a knowledge base record in Upstash Redis.

Listing 11.1 Creating a new knowledge base route

```
import { NextResponse } from 'next/server';
import { createKnowledgeBase,
getAllKnowledgeBases } from '@/lib/database';

export async function POST(request) {
  try {
    const body = await request.json();
    const { name, description } = body;

    if (!name) {
      return NextResponse.json({ error: 'Name is required' }, { status: 400 });
    }

    const knowledgeBase =
await createKnowledgeBase({
        name,
        description: description || '',
      });

    return NextResponse.json(knowledgeBase);
  } catch (error) {
    console.error('Error creating knowledge base:', error);
    return NextResponse.json(
      { error: 'Failed to create knowledge base' },
      { status: 500 }
    );
  }
}
```

Imports the createKnowledgeBase and getAllKnowledgeBases functions from the database utility module

Calls the createKnowledgeBase function with the provided name and optional description to create a new knowledge base record in the database

Returns a JSON response containing the newly created knowledge base data with a 200 OK status

- *Document routes* (`[knowledgebaseId]/document/[id]`)—These routes manage document-specific actions such as uploading, fetching, and deleting documents within a knowledge base. Uploaded documents are processed and parsed, and their vector embeddings are stored for retrieval.
- *Upload route* (`/api/upload`)—This endpoint receives file uploads from the frontend, associates them with the correct knowledge base, and triggers document processing and vectorization workflows.
- *Chat routes* (`/api/chat/[knowledgebaseId]`)—These routes facilitate the conversational interface, handling user queries, retrieving relevant document chunks from the vector store, and generating AI responses.

KNOWLEDGEBASE CHAT PAGE

The Knowledgebase Chat Page is the core user interface where users interact with the AI assistant to ask questions about the documents stored within a selected knowledge
