3 Configure API key settings. You may be prompted to configure settings for your API key. This will include specifying the project that the key is assigned for (see figure A.4).

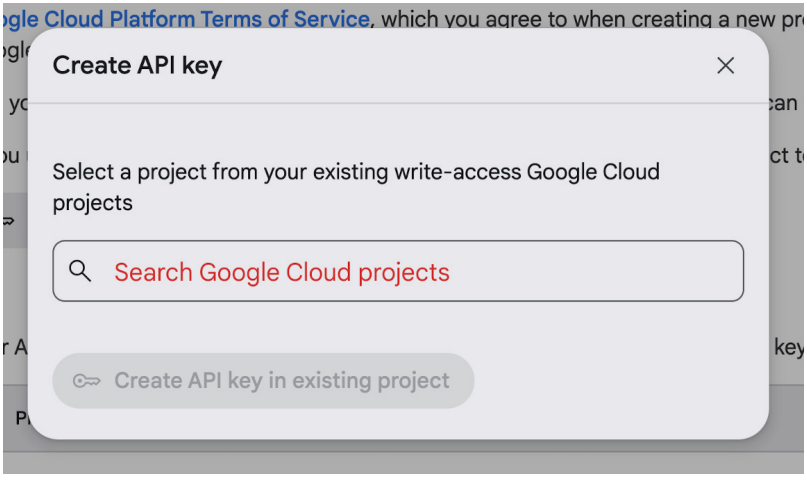

Figure A.4 Selecting a Google project to assign the API key

4 Generate the API key. After configuring the settings, click the Generate button. The system will create your API key. Once the API key is generated, it will be displayed on the screen. Make sure to copy this key and store it in a secure location, as you will need it to authenticate your requests to the Google AI services.

5 Once you have your Google API key, you need to add it to your project. In the root directory of the project you want to run, create a file named .env and add the secret key there:

```
GOOGLE_API_KEY=your_secret_key_here
```

Now you should be able to access the AI model functionality.

A.4 Accessing the Upstash Redis database

To integrate Upstash Redis into your full-stack AI web application, you need to create a Redis database and obtain the necessary connection details. Here's a step-by-step guide on how to do this:

1 Create an Upstash account. Go to https://upstash.com/ and create an account if you haven't already.

2 Once you have an account, log in to the Upstash console. You will see the page shown in figure A.5.
