Manager, we can install it through the command line. The following command adds the library as a dependency to our project:

```
$ npm i ai
```

While this package installs the Vercel AI core features, it does not cover the AI providers feature. For this we need to install the `@ai-sdk` package, which we will explore later in this chapter.

2 *Update the route handler*—Locate the route handler for the chat completions API and update it to reflect the code in the following listing.

Listing 3.2 Route handler

```
import { createGoogleGenerativeAI } from '@ai-sdk/google';
import { generateText } from 'ai';
import { v4 as uuidv4 } from 'uuid';

export const dynamic = 'force-dynamic';

const model = createGoogleGenerativeAI ({.
  apiKey: process.env.GEMINI_API_KEY || '',
});

export async function POST(req) {
  const { messages } = await req.json();

  const result = await generateText({
    model: model('gemini-2.0-flash'),
    maxTokens: 512,
    messages: [
      {
        role: 'system',
        content: "I'm happy to assist you in any way I can.
How can I be of service today?",
      },
      ...messages,
    ],
  });
  const message = {.
    id: uuidv4(),
    role: 'assistant',
    content: result.text, // Extract content from message
  };
  return Response.json({ message });
}
```

Imports the Google AI provider from the @ai-sdk package

Imports the generateText function that calls the provider and generates a text completion

Creates an instance of the Google provider to use for interacting with the API

Calls the generateText function, providing a Google model instance

Creates and returns the response message

To use the drop-in replacement provider for the Google Gemini chat completions API, you need to install an additional dependency:
