use with the `useChat` and `useCompletion` hooks. This is more like a technical detail, though, since the `streamText` response returns an object of type `StreamTextResult`, which represents a generic way of accessing different stream types and is specific to this package.

The following code listing shows the annotated code that implements these points.

**Listing 3.7 API route for chat application**

```
import { createGoogleGenerativeAI } from '@ai-sdk/google';
import { streamText } from 'ai';

export const dynamic = 'force-dynamic';

const model = createGoogleGenerativeAI ({
  apiKey: process.env.GEMINI_API_KEY || '',
});

export async function POST(req) {
  const { messages } = await req.json();

  const result = await streamText({.
    model: model('models/gemini-2.0-flash'),
    maxTokens: 512,
    messages: [
      {
        role: 'system',
        content: "I'm happy to assist you in any way I can.
How can I be of service today?",
      },
      ...messages,
    ],
  });
  const stream = result.toDataStream();
  return new Response(stream, {
    status: 200,
    contentType: 'text/plain; charset=utf-8',
  });
    }
```

**Imports the necessary utilities from the ai package, including StreamingTextResponse, streamText, and StreamData.**

**Uses the streamText function instead of generateText to generate a stream of text from the language model**

**Creates a new instance of DataStream to hold the streaming data**

**Converts the AI stream response to a Response instance, passing the stream, an empty options object, and the DataStream instance.**

This code snippet handles chat message requests by utilizing streaming text generation using the `ai` package to provide a more interactive experience for the user. It manages the streaming data and prepares a formatted response object for the client.

3 Replace the custom `useChatFormSubmit` hook with the `useChat` hook from the `ai` package. This hook, which I explained earlier, understands how to handle streaming chat messages from the AI provider and update the UI whenever there are new messages.
