Appendix D. C++ Thread Library reference

D.1. The <chrono> header

The `<chrono>` header provides classes for representing points in time and `durations` and clock classes, which act as a source of `time_points`. Each clock has an `is_steady` static data member, which indicates whether it's a *steady* clock that advances at a uniform rate (and can't be adjusted). The `std::chrono::steady_clock` class is the only clock guaranteed to be *steady*.

Header contents

```
namespace std
{
   namespace chrono
   {
       template<typename Rep,typename Period = ratio<1>>
       class duration;
       template<
            typename Clock,
            typename Duration = typename Clock::duration>
       class time_point;
       class system_clock;
       class steady_clock;
       typedef unspecified-clock-type high_resolution_clock;
   }
}
```

D.1.1. std::chrono::duration class template

The `std::chrono::duration` class template provides a facility for representing durations. The template parameters `Rep` and `Period` are the data type to store the duration value and an instantiation of the `std::ratio` class template indicating the length of time (as a fraction of a second) between successive "ticks," respectively. Thus `std::chrono::duration<int, std::milli>` is a count of milliseconds stored in a value of type `int`, whereas
