```
constexpr duration max();
```

Returns

```
duration(duration_values<rep>::max());
```

Std::Chrono::Duration Equality Comparison Operator

Compares two `duration` objects for equality, even if they have distinct representations and/or periods.

Declaration

```
template <class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(
     const duration<Rep1, Period1>& lhs,
     const duration<Rep2, Period2>& rhs);
```

Requirements

Either `lhs` must be implicitly convertible to `rhs`, or vice versa. If neither can be implicitly converted to the other, or they are distinct instantiations of `duration` but each can implicitly convert to the other, the expression is ill formed.

Effects

If `CommonDuration` is a synonym for `std::common_type< duration< Rep1, Period1>, duration< Rep2, Period2>>::type`, then `lhs==rhs` returns `CommonDuration(lhs).count()==CommonDuration(rhs).count()`.

Std::Chrono::Duration Inequality Comparison Operator

Compares two `duration` objects for inequality, even if they have distinct representations and/or periods.

Declaration
