`Period2>>::type`, then `lhs<rhs` returns `CommonDuration(lhs).count() <CommonDuration(rhs).count()`.

Std::Chrono::Duration Greater-Than Comparison Operator

Compares two `duration` objects to see if one is greater than the other, even if they have distinct representations and/or periods.

Declaration

```
template <class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(
     const duration<Rep1, Period1>& lhs,
     const duration<Rep2, Period2>& rhs);
```

Requirements

Either `lhs` must be implicitly convertible to `rhs`, or vice versa. If neither can be implicitly converted to the other, or they are distinct instantiations of `duration` but each can implicitly convert to the other, the expression is ill formed.

Returns

```
rhs<lhs
```

Std::Chrono::Duration Less-Than-or-Equals Comparison Operator

Compares two `duration` objects to see if one is less than or equal to the other, even if they have distinct representations and/or periods.

Declaration

```
template <class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(
     const duration<Rep1, Period1>& lhs,
     const duration<Rep2, Period2>& rhs);
```

Requirements
