```
template <class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

Requirements

`ToDuration` must be an instantiation of `std::chrono::duration`.

Returns

The duration `d` converted to the duration type specified by `ToDuration`. This is done in such a way as to minimize any loss of precision resulting from conversions between different scales and representation types.

D.1.2. std::chrono::time_point class template

The `std::chrono::time_point` class template represents a point in time, as measured by a particular clock. It's specified as a duration since the *epoch* of that particular clock. The template parameter `Clock` identifies the clock (each distinct clock must have a unique type), whereas the `Duration` template parameter is the type to use for measuring the duration since the epoch and must be an instantiation of the `std::chrono::duration` class template. The `Duration` defaults to the default duration type of the `Clock`.

Class definition

```
template <class Clock,class Duration = typename Clock::duration>
class time_point
{
public:
    typedef Clock clock;
    typedef Duration duration;
    typedef typename duration::rep rep;
    typedef typename duration::period period;

    time_point();
    explicit time_point(const duration& d);

    template <class Duration2>
    time_point(const time_point<clock, Duration2>& t);
```
