```
static constexpr time_point min();
```

Returns

```
time_point(time_point::duration::min()) (see 11.1.1.15)
```

Std::Chrono::Time_Point::Max Static Member Function

Obtains a `time_point` object representing the maximum possible value for its type.

Declaration

```
static constexpr time_point max();
```

Returns

```
time_point(time_point::duration::max()) (see 11.1.1.16)
```

D.1.3. std::chrono::system_clock class

The `std::chrono::system_clock` class provides a means of obtaining the current wall-clock time from the systemwide real-time clock. The current time can be obtained by calling `std::chrono::system_clock::now()`. Instances of `std::chrono::system_clock::time_point` can be converted to and from `time_t` with the `std::chrono::system_clock::to_time_t()` and `std::chrono::system_clock::to_time_point()` functions. The system clock isn't *steady*, so a subsequent call to `std::chrono::system_clock::now()` may return an earlier time than a previous call (for example, if the operating system clock is manually adjusted or synchronized with an external clock).

Class definition

```
class system_clock
{
public:
```
