A `time_t` value that represents the same point in time as `t` rounded or truncated to seconds precision.

Throws

An exception of type `std::system_error` if an error occurs.

Std::Chrono::System_Clock::From_Time_T Static Member Function

Converts an instance of `time_t` to `time_point`.

Declaration

```
time_point from_time_t(time_t const& t) noexcept;
```

Returns

A `time_point` value that represents the same point in time as `t`.

Throws

An exception of type `std::system_error` if an error occurs.

D.1.4. std::chrono::steady_clock class

The `std::chrono::steady_clock` class provides access to the systemwide steady clock. The current time can be obtained by calling `std::chrono::steady_clock::now()`. There is no fixed relationship between values returned by `std::chrono::steady_clock::now()` and wall-clock time. A steady clock can't go backwards, so if one call to `std::chrono::steady_clock::now()` happens-before another call to `std::chrono::steady_clock::now()`, the second call must return a time point equal to or later than the first. The clock advances at a uniform rate as far as possible.
