Class definition

```
class steady_clock
{
public:
    typedef unspecified-integral-type rep;
    typedef std::ratio<
        unspecified,unspecified> period;
    typedef std::chrono::duration<rep, period> duration;
    typedef std::chrono::time_point<steady_clock>
        time_point;
    static const bool is_steady=true;

    static time_point now() noexcept;
};
```

Std::Chrono::Steady_Clock::Rep Typedef

This typedef is for an integral type used to hold the number of ticks in a `duration` value.

Declaration

```
typedef unspecified-integral-type rep;
```

Std::Chrono::Steady_Clock::Period Typedef

This is a typedef for an instantiation of the `std::ratio` class template that specifies the smallest number of seconds (or fractions of a second) between distinct values of `duration` or `time_point`. The `period` specifies the *precision* of the clock, not the tick frequency.

Declaration

```
typedef std::ratio<unspecified, unspecified> period;
```

Std::Chrono::Steady_Clock::Duration Typedef

This is an instantiation of the `std::chrono::duration` class template that can hold the difference between any two time points returned by the systemwide steady clock.

Declaration
