The `std::chrono::high_resolution_clock` class provides access to the systemwide clock with the highest resolution. As for all clocks, the current time can be obtained by calling `std::chrono::high_resolution_clock::now()`. `std::chrono::high_resolution_clock` may be a typedef for the `std::chrono::system_clock` class or `std::chrono::steady_clock` class, or it may be a separate type.

Although `std::chrono::high_resolution_clock` has the highest resolution of all the library-supplied clocks, `std::chrono::high_resolution_clock::now()` still takes a finite amount of time. You must take care to account for the overhead of calling `std::chrono::high_resolution_clock::now()` when timing short operations.

Class definition

```
class high_resolution_clock
{
public:
    typedef unspecified-integral-type rep;
    typedef std::ratio<
        unspecified,unspecified> period;
    typedef std::chrono::duration<rep, period> duration;
    typedef std::chrono::time_point<
        unspecified> time_point;
    static const bool is_steady=unspecified;

    static time_point now() noexcept;
};
```

D.2. <condition_variable> header

The `<condition_variable>` header provides condition variables. These are basic-level synchronization mechanisms that allow a thread to block until notified that some condition is true or a timeout period has elapsed.

Header contents
