`std::condition_variable` instance are serialized. A call to `notify_one()` or `notify_all()` will only wake threads that started waiting *prior* to that call.

Std::Condition_Variable::Notify_All Member Function

Wake all of the threads currently waiting on a `std::condition_variable`.

Declaration

```
void notify_all() noexcept;
```

Effects

Wakes all of the threads waiting on `*this` at the point of the call. If there are no threads waiting, the call has no effect.

Throws

`std::system_error` if the effects can't be achieved.

Synchronization

Calls to `notify_one(), notify_all(), wait(), wait_for()`, and `wait_until()` on a single `std::condition_variable` instance are serialized. A call to `notify_one()` or `notify_all()` will only wake threads that started waiting *prior* to that call.

Std::Condition_Variable::Wait Member Function

Waits until the `std::condition_variable` is woken by a call to `notify_one()` or `notify_all()` or a spurious wakeup.

Declaration
