Calls to `notify_one(), notify_all(), wait(), wait_for()`, and `wait_until()` on a single `std::condition_variable_any` instance are serialized. A call to `notify_one()` or `notify_all()` will only wake threads that started waiting *prior* to that call.

Std::Condition_Variable_Any::Wait Member Function

Waits until the `std::condition_variable_any` is woken by a call to `notify_one()` or `notify_all()` or a spurious wakeup.

Declaration

```
template<typename Lockable>
void wait(Lockable& lock);
```

Preconditions

`Lockable` meets the `Lockable` requirements, and `lock` owns a lock.

Effects

Atomically unlocks the supplied `lock` object and block until the thread is woken by a call to `notify_one()` or `notify_all()` by another thread, or the thread is woken spuriously. The `lock` object is locked again before the call to `wait()` returns.

Throws

`std::system_error` if the effects can't be achieved. If the `lock` object is unlocked during the call to `wait()`, it's locked again on exit, even if the function exits via an exception.

Note
