Constructs an instance of `std::atomic` with a default-initialized value.

Declaration

```
atomic() noexcept;
```

Effects

Constructs a new `std::atomic` object with a default-initialized value. For objects with static storage duration this is static initialization.

Note

Instances of `std::atomic` with nonstatic storage duration initialized with the default constructor can't be relied on to have a predictable value.

Throws

Nothing.

Std::Atomic_Init Nonmember Function

Nonatomically stores the supplied value in an instance of `std::atomic<BaseType>`.

Declaration

```
template<typename BaseType>
void atomic_init(atomic<BaseType> volatile* p, BaseType v)
noexcept;
template<typename BaseType>
void atomic_init(atomic<BaseType>* p, BaseType v) noexcept;
```

Effects
