Nonatomically stores the value of `v` in `*p`. Invoking `atomic_init()` on an instance of `atomic<BaseType>` that hasn't been default constructed, or that has had any operations performed on it since construction, is undefined behavior.

Note

Because this store is nonatomic, any concurrent access to the object pointed to by `p` from another thread (even with atomic operations) constitutes a data race.

Throws

Nothing.

Std::Atomic Conversion Constructor

Construct an instance of `std::atomic` with the supplied `BaseType` value.

Declaration

```
constexpr atomic(BaseType b) noexcept;
```

Effects

Constructs a new `std::atomic` object with a value of `b`. For objects with static storage duration this is static initialization.

Throws

Nothing.

Std::Atomic Conversion Assignment Operator
