Atomically decrements the value stored in `*this` using standard pointer arithmetic rules and returns the old value.

Declaration

```
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
```

Effects

```
return this->fetch_sub(1);
```

Std::Atomic<T*>::Operator+= Compound Assignment Operator

Atomically adds the supplied value to the value stored in `*this` using standard pointer arithmetic rules and returns the new value.

Declaration

```
T* operator+=(ptrdiff_t i) volatile noexcept;
T* operator+=(ptrdiff_t i) noexcept;
```

Effects

```
return this->fetch_add(i) + i;
```

Std::Atomic<T*>::Operator-= Compound Assignment Operator

Atomically subtracts the supplied value from the value stored in `*this` using standard pointer arithmetic rules and returns the new value.

Declaration

```
T* operator-=(ptrdiff_t i) volatile noexcept;
T* operator-=(ptrdiff_t i) noexcept;
```

Effects

```
return this->fetch_sub(i) - i;
```
