Effects

Move-constructs a new `std::future` instance from `other`.

Postconditions

The asynchronous result associated with `other` prior to the invocation of the constructor is associated with the newly constructed `std::future` object. `other` has no associated asynchronous result. `this->valid()` returns the same value that `other.valid()` returned before the invocation of this constructor. `other.valid()` returns `false`.

Throws

Nothing.

Std::Future Move Assignment Operator

Transfers ownership of the asynchronous result associated with the one `std::future` object to another.

Declaration

```
future(future&& other) noexcept;
```

Effects

Transfers ownership of an asynchronous state between `std::future` instances.

Postconditions

The asynchronous result associated with `other` prior to the invocation of the constructor is associated with `*this`. `other` has no associated asynchronous result. The ownership of the asynchronous state (if any) associated with `*this` prior to the call is released, and the state destroyed
