The completion of the thread that made a successful call to `make_ready_at_thread_exit()` synchronizes-with a call to `std::future<ResultType>::get()` or `std::shared_future<ResultType>::get()`, which retrieves the value or exception stored.

D.4.4. std::promise class template

The `std::promise` class template provides a means of setting an asynchronous result, which may be retrieved from another thread through an instance of `std::future`.

The `ResultType` template parameter is the type of the value that can be stored in the asynchronous result.

A `std::future` associated with the asynchronous result of a particular `std::promise` instance can be obtained by calling the `get_future()` member function. The asynchronous result is set either to a value of type `ResultType` with the `set_value()` member function or to an exception with the `set_exception()` member function.

Instances of `std::promise` are `MoveConstructible` and `MoveAssignable` but not `CopyConstructible` or `CopyAssignable`.

Class definition

```
template<typename ResultType>
class promise
{
public:
    promise();
    promise(promise&&) noexcept;
    ~promise();
    promise& operator=(promise&&) noexcept;

    template<typename Allocator>
    promise(std::allocator_arg_t, Allocator const&);
```
