Constructs a `std::promise` instance with an associated asynchronous result of type `ResultType` that isn't *ready*. The memory for the asynchronous result is allocated through the allocator `alloc`.

Throws

Any exception thrown by the allocator when attempting to allocate memory for the asynchronous result.

Std::Promise Move Constructor

Constructs one `std::promise` object from another, transferring ownership of the asynchronous result associated with the other `std::promise` object to the newly constructed instance.

Declaration

```
promise(promise&& other) noexcept;
```

Effects

Constructs a new `std::promise` instance.

Postconditions

The asynchronous result associated with `other` prior to the invocation of the constructor is associated with the newly constructed `std::promise` object. `other` has no associated asynchronous result.

Throws

Nothing.

Std::Promise Move-Assignment Operator

Transfers ownership of the asynchronous result associated with one `std::promise` object to another.
