Stores an exception in the asynchronous result associated with `*this` without making that result *ready* until the current thread exits.

*Declaration*

```
void set_exception_at_thread_exit(std::exception_ptr e);
```

*Preconditions*

`*this` has an associated asynchronous result. `(bool)e` is `true`.

*Effects*

Stores `e` in the asynchronous result associated with `*this`. Schedules the associated asynchronous result to be made *ready* when the current thread exits.

*Postconditions*

The asynchronous result associated with `*this` has a stored exception but isn't *ready* until the current thread exits. Threads blocked waiting for the asynchronous result will be unblocked when the current thread exits.

*Throws*

An exception of type `std::future_error` with an error code of `std::future_errc::promise_already_satisfied` if the asynchronous result already has a stored value or exception.

*Synchronization*

Multiple concurrent calls to `set_value()`, `set_value_at_thread_exit()`, `set_exception()`, and `set_exception_at_thread_exit()` are serialized. The completion of the thread that made a successful call to `set_exception_at_thread_exit()` happens-before a call to
