Returns

`true` if a lock was obtained for the calling thread, `false` otherwise.

Postconditions

A new lock on `*this` has been obtained for the calling thread if the function returns `true`.

Throws

Nothing.

Note

If the calling thread already holds the lock on `*this`, the function returns `true` and the count of locks on `*this` held by the calling thread is increased by one. If the current thread doesn't already hold a lock on `*this`, the function may fail to acquire the lock (and return `false`) even if no other thread holds a lock on `*this`.

Std::Recursive_Mutex::Unlock Member Function

Releases a lock on a `std::recursive_mutex` object held by the current thread.

Declaration

```
void unlock();
```

Preconditions

The calling thread must hold a lock on `*this`.
